

THE PROFESSIONAL AI COMMAND GUIDE

BONUS QUICK REFERENCE • Keep this beside your AI tool.

The 6-Part Prompt Formula

ROLE + TASK + CONTEXT + CONSTRAINTS + OUTPUT + CHECK

Act as [role]. Help me [task]. Context: [context]. Constraints: [constraints]. Return [format]. Before finishing, check [quality criteria].

Fix a Weak Answer

Do not restart immediately. Iterate.

Make it shorter. • Give me 3 alternatives. • Explain point #3. • Keep everything except paragraph 2. • What information are you missing? • Check your previous answer for mistakes.

Accuracy Check

Use when facts matter.

Separate verified facts, assumptions, estimates, and unknowns. Identify the claims most likely to be wrong. Tell me what should be verified before I act.

Writing Upgrade

For email, posts, reports and documents.

Preserve my meaning and voice. Improve clarity and flow. Remove filler and jargon. Use active voice. Give me a concise final version.

Decision Prompt

For purchases, career choices and business decisions.

Compare my options using cost, risk, time, upside, reversibility and likelihood of success. Recommend one option and state what would change your recommendation.

Learning Prompt

For unfamiliar subjects.

Teach this in four layers: intuition, simple example, technical explanation, then a short quiz. Do not continue until I answer the checkpoint.

Research Prompt

For current or evidence-sensitive questions.

Research this using current credible sources. Prioritize primary/official sources. Separate evidence from inference and cite claims that may have changed.

Privacy Check

Before pasting sensitive material.

Could this contain passwords, API keys, personal identifiers, confidential company data, medical details, financial account data, or information I do not have permission to share? Redact first.

10 High-Value Copy/Paste Prompts

1. Direct answer

Give me the direct answer first. Explain only what I need to understand the recommendation.

2. Beginner mode

Explain this as if I am new to the topic. Define jargon the first time you use it.

3. Improve my prompt

Rewrite my request into a stronger prompt with goal, context, constraints, output format and quality criteria. Then execute it.

4. Challenge me

Challenge my assumptions. Give me the strongest argument against my current plan and identify hidden risks.

5. Summarize

Give me a one-sentence summary, five key points, important numbers, decisions, action items and unresolved questions.

6. Document analysis

Separate what the document explicitly says from what you infer. Identify obligations, deadlines, amounts, exceptions and risks.

7. Interview practice

Ask one realistic interview question at a time. Score my answer, identify weaknesses, improve it, then ask a harder follow-up.

8. Code review

Review for correctness, edge cases, complexity, security, concurrency, failure recovery, observability, maintainability and tests. Rank findings by severity.

9. Plan

Turn this goal into milestones, next actions, dependencies, risks and a realistic timeline. Start with the smallest useful next step.

10. Self-check

Before finalizing, check your answer for contradictions, unsupported claims, missing constraints and places where uncertainty should be stated.
